Objective

As a seasoned Full Stack Developer and Technical Lead, I bring over 20 years of experience in designing and implementing robust software solutions across various industries and domains. My expertise spans frontend, backend and mobile development, architecture redesign, CI/CD implementation using cutting-edge technologies like NodeJS, TypeScript, ReactJS, Java, Docker/Kubernetes, SDR/DSP, Deep Learning. I am passionate about leading teams to deliver high-quality products, optimizing existing systems, and driving innovation through scalable and maintainable code. Seeking to leverage my skills and experience in a challenging role that allows me to contribute to impactful projects and guide teams toward success.

Professional Experience

2015–today	Teamlead and Software Architect at Luxoft. Head of FE development team. Redesigned architecture from monolith to granular. Introduced an API for the 3-d parties for smooth integration of apps into a main solution. Migrated FE development stack from Java/GWT to ReactJS/Redux. Built development processes like automation, code review, e2e and incorporated deployment pipelines using Docker/K8S. Tightly worked with the customer on prototyping, feature validation and UX improvements.
2014–215	TechLead at Playtika. Led the refactoring team in implementing a new data layer for a high-traffic back-end (100k daily active users). Coordinated development efforts across feature teams.
2010–2014	Sr. Software Engineer, TechLead at SoftServe. Contributed to various projects in multiple roles, including desktop, back-end, and mobile software engineer, as well as Tech Lead. Led feature implementation, architectural (re)design, team coaching, and maintained effective communication with clients.
2008–2010	Sr. Software Engineer at ISD. Was responsible for server-side logic and services development. Designed an API contract for 3-d party systems integration. Contributed to relocating projects to our location, prepared the migration plan, and facilitated knowledge sharing for local teams.
2005–2008	Sr. Software Engineer at RTS-Ukraine. Primarily focused on UI implementation using Java frameworks. Additionally gained experience in low-level, client/server programming, developing drivers, and reverse engineering.

Education & Certificates

2017	M101JS: MongoDB for Node.js Developers
2012	Java OCJP 1.6(1Z0-851)
2001–2006	Master of Automation of Technological Processes, PSACEA , Ukraine.

Additional Information

Languages	Ukrainian, Russian, English B2

Projects

2025–now	Pager. (Complementary system to Sky Guard) To provide immediate tactical awareness at the unit level, Sky Guard system includes a distributed real-time alerting subsystem. Upon detection of a confirmed threat, the system generates real-time alerts distributed to portable notification devices (pager-type receivers) carried by personnel. These alert devices provide immediate warning of FPV activity without requiring continuous monitoring of the main system interface, ensuring rapid awareness even under high operational workload or limited visibility conditions. The distributed alert architecture allows units to extend situational awareness beyond the sensor location, enabling timely reaction such as activation of electronic warfare measures, personnel warning, repositioning, or protective actions. C++, PyTorch, SDR/DSP, LoRa, OrangePi/BladeRF
2025–now	Sky Guard (Personal and Stationary version). The FPV Early Warning & Video Presence Detection System is a stationary electronic monitoring solution designed to provide early detection of enemy FPV video transmission channels across a wide RF spectrum. The system continuously scans the 10006000 MHz range, automatically detects active FPV video channels, identifies operating frequencies using deep-learning models, and verifies the actual presence of usable video streams. This enables operators to distinguish real threats from noise, weak signals, or false detections. The primary mission is early threat awareness, allowing units to activate countermeasures, alert personnel, and protect critical positions or infrastructure. C++, PyTorch, SDR/DSP, OrangePi/BladeRF
2024–2025	Drone detector. Personal R&D project focused on detecting and classifying UAVs. The project incorporates technologies such as Software-Defined Radio (SDR), Digital Signal Processing (DSP), and Deep Learning for signal classification using raw IQ data. Several challenges were addressed, including the implementation of rapid scanning across a wide range of frequencies and prototyping and evaluating different deep learning models to ensure functionality on an embedded edge device. As a final solution, this is a hardware-software offline device which implements a data processing pipeline. It gets IQ data and passes it through two Deep Learning models. The first one finds signal boundaries (frequency range(s) and duration time of data packets) in the frequency domain; the second one performs classification of the IQ data found in the previous step. C++, Python, PyTorch, SDR/DSP, Nvidia Jetson Orin/BladeRF
2015–2023	DBoard.

	Led the frontend team, gaining the customer's trust by proposing and successfully implementing a long-term refactoring plan. Evolved the entire application suite by migrating from a monolithic to a granular architecture, which increased application reliability. Planned and executed the migration of the development stack, significantly improving performance, which in turn allowed for product promotion and the attraction of more users. Worked closely on new feature proposals and validation. Implemented numerous improvements to development and testing processes, including the introduction of CI/CD and the establishment of feature teams. Java, GWT, Tomcat, JavaScript, HTML/CSS, TypeScript, React/Redux, NodeJS, Nginx, Docker/K8S, Figma/Sketch
2015–2018	Horizon Platform. Managed a small team of developers responsible for maintaining a legacy UI platform for data analytics. Java, Spring IoC/MVC, GWT, Tomcat, JavaScript, HTML/CSS
2014–2015	Caesars Casino. Managed a refactoring team focused on improving the backend of a high-load application. Led and participated in the refactoring of the data layer, which resulted in enhanced API integration and overall performance, enabling faster feature implementations. Acted as a technical mediator between multiple feature teams to plan a delivery roadmap that avoided breaking changes. Java, Spring IoC/MVC, MySQL, CouchBase

2013–2014	Weather Underground. There was a request from the customer to analyze the mobile application architecture and provide a solution for redesigning the map engine. As a result, significant performance improvements through several changes were done, including splitting the app into separate components (UI and services) and implementing predictive map rendering. Java, Android
2012–2013	Bemo. Participated as the lead of the Android team in a pilot R&D project. Designed the application architecture, UI, and several subsystems, including media file management, gallery synchronization, effects editor, video streaming, and a player for media files. Java, Java JNI, C, Android
2011–2012	Alert. Redesigned the architecture of the Android client application. Implemented real-time video streaming, including an H264 video player with a decoder, for indoor and outdoor cameras. Optimized the existing MJPEG streaming and overall application architecture. Improved overall application performance and UX. Java, Java JNI, C, Android
2011–2011	iText. Developed an Android application for a custom Android board. Implemented log management and developed the integration and communication layer with ZigBee sensors. Java, Java JNI, C, Android
2011–2011	Gazzang. Implemented e2e test for the secure cloud storage. Python
2011–2011	TestSurvey. Developed a desktop application for managing and executing tests with complex branching logic. Java, ANTLR
2010–2011	Basecamp. Developed a web-based analytics application for the financial department. Java, Spring IoT/MVC, HTML/CSS
2010–2010	Genetics. Contributed to the development and refactoring of an application suite in the healthcare domain. Led the project relocation to a local office and coached a team of developers who were designated to maintain it in the future. Java, JBoss, EJB3, Oracle database

2008–2010	TotalQC. Developed and refactored number of web services. Was responsible for integration with 3-d party applications. Java, JBoss, EJB3, Oracle database
2007–2008	S3-IDE. Developed desktop applications and UI features using the NetBeans Platform. Implemented a code editor with syntax highlighting for the PLC programming language and created a client/server application for managing project files on remote embedded systems. Java, Swing, NetBeans Platform, ANTLR, C
2005–2007	Octavo. Developed desktop applications and UI features. Implemented various drivers for digital/analog I/O boards and modules for QNX RTOS. Reverse-engineered several Linux drivers. Java, SWT, C, QNX
